**Figure 1:**

A repeated measures ANOVA analysis showed significant differences in the mean score of the dependent variable across the three groups. The effect size was large, indicating a strong relationship between the independent and dependent variables. The post-hoc comparisons revealed that Group A had significantly higher scores than Group B and Group C, whereas Group B did not differ significantly from Group C.

---

**Discussion:**

The findings of this study highlight the importance of evaluating the impact of intervention programs on health outcomes. The results suggest that the intervention strategies implemented in the study were effective in improving the health status of the participants. The long-term effects of the intervention on the participants' health will be further studied in future research.

**Conclusion:**

In conclusion, the study demonstrates the effectiveness of the intervention strategies in improving health outcomes. Further research is needed to explore the sustainability and scalability of the intervention programs.

**Examples:**

1. **Introduction**
   - Smith et al. (2022) reported that Jones et al. (2021) found evidence to support the importance of the intervention.

2. **Discussion**
   - Jones (2022) reported that Smith et al. (2021) found no significant differences in the outcomes between the two groups.

3. **Conclusion**
   - This study had as its primary goal...
